

## Resource Library

With the abundance of compliance-related standards, healthcare organizations have to gather, maintain, update, and store huge amounts of process documentation. Ensuring this documentation is available, centralized, and accessible to appropriate personnel at all times requires focus and attention to detail.

The Resource Library module provides on-demand access capabilities, a searchable document repository, a “content vault” of pre-populated templates, and a customizable forms generator. These features drastically reduce the amount of time needed to manage your documentation, so your staff can use their time for more urgent needs.

The searchable document repository contains all documentation stored throughout MIDAS+ JRepository. The content vault contains more than 400 pre-populated policies and procedures, forms, logs, and tools which your organization can customize as needed. Each template is automatically updated and deployed to all clients by the MIDAS+ Accreditation Solutions Group support staff, ensuring the most recent compliance standards language is available.

The standard set manager feature provides access to applicable regulatory standards. The custom form generator allows users to complete and manage forms already in use, or create new forms using a step-by-step wizard. You can not only use these forms to manage processes, but you can also relate them to one or more performance elements, thereby establishing evidence of standards compliance.

The labor-saving tools in the Resource Library allow your staff to spend more time analyzing information and making informed decisions, and less time merely collecting information.

### Features & Benefits

- Access documentation on demand from a centralized, interactive repository
- Quickly retrieve documentation with searchable fields and related keywords
- Immediately use any of over 400 compliance-based templates from the content vault
- Access the most recent set of applicable regulatory standards
- Create custom forms with a step-by-step wizard, and relate them to performance elements
- Quickly retrieve any requested documents with on-demand access, searchable fields, and related keywords
- Include other compliance-related data to provide additional levels of compliance detail
