

With the abundance of accreditation performance requirements, the process of managing compliance with Joint Commission standards has been a labor intensive, monumental task for every healthcare organization. The MIDAS+ JRepository® solution enables healthcare organizations to transition to a state of continuous compliance and attain realistic achievements in patient safety quality by capturing and managing quality data in one web-based application that is readily accessible to enabled users with on demand, real-time reporting and the following included modules: Assessments, Tracers, Event Reporting, Corrective Action Plans, Emergency Preparedness, Competency Management, Resource Library & Reporting Management.

By utilizing the MIDAS+ JRepository solution to manage these complex processes, your organization can move away from the labor intensive and redundant paper based processes that have frustrated Quality Managers in their efforts to achieve real, demonstrable gains in compliance and patient safety quality improvement.

#### **Features and Benefits**

- JRepository distributes traditionally narrow-focused, departmental, labor intensive processes across the organization using inherent workgroup methodology resulting in shared ownership and accurate reflection of the organization's compliance
- Corrective action plans are automatically created in each instance of less than full compliance; therefore all information is maintained and actively managed as needed
- Tracer module and pre-built tracer templates eliminate the need and associated cost of external consultants and mock surveys
- Executives, managers and workgroup leaders can view progress in real time; hence no need to wait for reports as current status and information is a mouse click away
- Facility Document Repository allows all compliance participants to reference and contribute documents demonstrating how the organization meets performance requirements; version control maintains document integrity while access is expanded to all authorized users
- The Event Reporting module for the management of incidents and occurrences, including the entire Root Cause Analysis process, associated corrective action plans, and prioritization are fully integrated into the solution
- The Emergency Preparedness module contains emergency management policies, forms and tools, hazard vulnerability analysis (HVA), emergency related tracers, and auto-generated Corrective Action Plans to determine staff preparedness, and templates for conducting drills and defining roles and responsibilities
- The Competency Management module allows an organization to modify a pre-built competency library and actively manage competency requirements across the organization to ensure all staff members successfully complete each requirement
- Within the Resource Library, the Content Vault provides over 400+ policies, procedures, forms, logs and tools which are related to various standards and automatically updated
